Workflows

A faceless AI video pipeline in *7 free steps*

Script, voice, B-roll, motion, sound, captions, scheduling

7 free *steps*

01 · Script

Write it with free models

Route drafts through FreeLLMAPI or OmniRoute: one endpoint over many free tiers. Prompt: "Write a 70-word voiceover. One idea per line. Every number needs a source link."

02 · Voice

Voice it with an open model

Kokoro-82M has [Apache-licensed weights](#). Hugging Face's new Open TTS Leaderboard puts it among the top three on English intelligibility. Use the Listen tab before you pick.

03 · B-roll

Screen-record the real thing

Record the actual repo, docs page or changelog you talk about. OBS Studio is free and open source on Windows, Mac and Linux. **Real screens** beat stock typing clips.

04 · Motion

Animate text with code

Remotion builds videos with React. Free, even commercially, for individuals and companies with up to 3 employees. Bigger teams need a company licence. One idea per screen.

05 · Sound

Use sounds you're allowed to use

Freesound uses Creative Commons. **CC0** means use freely. Attribution means credit the creator. Noncommercial means no ads. A soft whoosh per scene change is enough.

06 · Captions

Caption every word

Transcribe your own voiceover so captions match exactly. Hugging Face calls Qwen3 ASR the top open model on its Open ASR Leaderboard. Fix names and numbers **by hand**.

07 · Schedule

Schedule, then show up

Buffer's free plan connects up to 3 channels with 10 scheduled posts each. Automation can publish. It can't reply to comments **like you do**.

The honest catch

01 Free tiers have daily caps

02 Open models still make mistakes

03 Every licence reads differently

04 Facts need a human check
